# Diabetes Case Study Problem Statement

## Case Study Title

## Introduction

- Provide background information about diabetes and its prevalence.
- Mention the specific type or aspect of diabetes being studied (e.g., Type 1, Type 2, diabetes management).

## Problem Statement

- Identify the specific problem faced by the patient or population (e.g., ineffective blood sugar control, complications due to diabetes).
- Include measurable parameters (e.g., HbA1c levels, glucose variability).
- Discuss the impact of this problem on the patient's health and quality of life.

## Objective of the Case Study

- State the objective (e.g., improve blood sugar control, reduce complications).
- Define what the study aims to achieve in terms of patient health or treatment effectiveness.

## Scope

- Focus on the patient group, specific treatment protocols, or lifestyle factors involved.
- Include any limitations related to the study (e.g., sample size, duration of treatment).

## **Key Stakeholders**

- Mention relevant stakeholders such as healthcare providers, patients, and medical researchers.

## **Expected Outcomes**

- Specify outcomes like better glycemic control, improved patient education, or enhanced treatment adherence.
