

Solving Proportions

Ratio- a comparison of two numbers by division (usually written as a fraction) with the same units

Equivalent Fractions- two fractions that have the same value (but use different numerators and denominators)

Proportion-two ratios set equal to one another (with the same units matching on the top and bottom)

Fish Method-

- Start with the number above/below the variable
- Draw a fish
- Multiply the first two numbers together along the fish
- Divide by the last number (end on the variable)
